

ALUMINIUM IN MINING

Aluminium's strength, light weight and versatility make it an ideal material for the mining industry.

Aluminium is strong enough to stand up to the roughest treatment due to its extreme durability. It is quick and easy to wash down and will not spark. Thanks to its excellent corrosion resistance, aluminium systems have been tested and estimated to last up to 10 years in highly corrosive environments such as gold processing plants.

Aluminium has been successfully used for many years in mining operations in applications such as man cages and skips, detonator caps and sheave wheels to name but a few.

Choose the aluminium solution.
